9. ABSTRACT (Continue on reverse if necessary and identify by block number)

Elastomeric seals used in gun mounts have a hard to achieve combination of properties, so acceptable seals are difficult to procure and few sources are available. Therefore, two rubber formulations were developed, each for a different hydraulic oil, with the intention of providing the manufacturing data to U.S. Government activities and potential vendors.

As in-house Army fabrication capability is needed for the seal kit for the M140 gun mount, polytetrafluoroethylene (PTFE) tubes and cloth-filled phenolic sheet were procured for back-up rings in the kit. Subsequent gymnastication demonstrated Rock Island Arsenal has the capability of fabricating all the seals in the kit according to the technical data.

MANUFACTURING GUIDE FOR ELASTOMERIC SEALS

INTRODUCTION:

One of the objectives of this effort was to increase competition for purchasing elastomeric seals for Army weapons systems where acceptable seals were available from only one or a few vendors and were difficult to fabricate. Manufacturing data from tested formulations would be provided for vendors or U.S. Government activities. This work was also directed toward establishing Army in-house capability of manufacturing seal kits for the M140 Gun Mount. These kits consist of six elastomeric seals, four polytetrafluoroethylene (PTFE) back-up rings and one cloth-filled phenolic ring. Such an in-house capability would assure a ready source of supply for seal kits to be installed in M140 and other gun mounts manufactured at Rock Island Arsenal.

ELASTOMERIC SEALS:

Elastomeric seal drawings were surveyed to determine the most needed seal materials for Army weapon systems. Drawing 8689822 was found to provide a suitable material call-out for use in many weapon systems where MIL-H-6083 hydraulic oil is used, especially for the M178 Gun Mount. The requirements of that drawing, with the exception of substituting MIL-H-46170 hydraulic oil for MIL-H-6083, were required for the seals for the M140 Gun Mount.

Drawing 8689822 cites 'Material: Rubber, Synthetic, Grade SB715A,E,F,Z₁,Z₂,Z₃,Z₄,Z₅,Z₆', Specification MIL-R-3065 and MIL-STD-417. The Z suffix requirements are defined as follows:

Z₁: Original Elongation - 150 percent minimum;

Z₂: 0 - 15 percent volume change after 70 hours immersion in MIL-H-6083 at 275 deg. F.;

Z₃: No evidence of corrosion or adhesion against steel when tested per MIL-P-5576;

Z₄: TR10 value of -51 deg. F., or colder when tested at 50 percent elongation per ASTM W1329. Material shall meet TR10 value of -51 deg. F. or colder after 70 hours heat soak in hydraulic fluid conforming to MIL-H-6083 at 70 deg. C. (158 deg. F.);

Z₅: Modulus at 100 percent elongation of 700 psi minimum, when tested per ASTM D412;

Z₆: Compression set after 70 hours at 212 deg. F. per ASTM D395, Method B performed on buttons - 23 percent maximum. The complete set of requirements for Grade SB715A,E,F,Z₁,Z₂,Z₃,Z₄,Z₅,Z₆ are presented in Table 1.

Examination reveals this combination of requirements, e.g., high modulus, low compression set, resistance to embrittlement at low temperature, good low temperature retraction before and after being soaked in hot hydraulic oil, resistance to petroleum oil at 275 deg. F. and corrosion resistance to steel is severe and difficult to achieve by using 'off-the-shelf' nitrile seal compound. Individually, any of the requirements is not too difficult to meet, even though it approaches the best attainable. However, when compounding to reach a best attainable property for any one requirement, other properties are sacrificed, so judicial compromises must be made to attain the desired combination.

TABLE 1

PHYSICAL PROPERTY REQUIREMENTS OF
GRADE SB715A₁E₃F₂Z₁Z₂Z₃Z₄Z₅Z₆ PER DRAWING 8689822*

<u>PROPERTY</u>	<u>REQUIREMENTS</u>
As received sample: (ASTM D 412 Method A)	
Tensile strength, psi.	1500 min.
(A1) After 70 hrs. @ 212 deg. F. in air, ASTM D 573.	
Tensile change, %.	-20 max.
Elongation change, %.	-40 max.

(Z1) Elongation, %.	150 min.
Hardness, Shore A, ASTM D 2240.	70 + 5
Temperature retraction, (TR10), deg. F. ASTM D 1320.	-51 or below
(Z2) After 70 hrs. @ 275 deg. F. in MIL-H-6083 oil*. ASTM D 471.	
Volume change, %.	0 to + 15
(Z3) Corrosion on steel, MIL-P-5516C.	No indication permitted
(Z4) After 70 hrs. @ 158 deg. F. in MIL-H-6083 oil.* Temperature retraction (TR10), deg. F.	
(Z5) Modulus @ 100% Elongation, psi.	-51 or below 700 min.
(Z6) After 70 hrs. @ 212 deg. F. in air, ASTM D 395 Method B. Compression set, %.	23 max.

* Other systems, e.g., the M140 Gun Mount, require substitution of MIL-H-46170 hydraulic oil.

Two nitrile rubber based compounds were developed to meet the call-out; one compound, N221, is intended for use with MIL-H-6083 hydraulic oil and the other, N220-1, for use with MIL-H-46170 (Table 2).

These compounds were mixed on a 2-roll laboratory mill measuring 6 X 12 inches. The same compounds were then mixed on a 30 X 12 inch mill used for production purposes to determine if there were any substantial differences in properties, especially stress-strain properties, between laboratory and shop mixed batches. Difference in the size of the rolls affects the mixing of the compounding ingredients into the rubber, mainly because larger rolls produce a different shearing action in the mix of rubber than do rolls of smaller diameter.

The following mixing procedure was followed in both the laboratory and shop:

1. Pass rubber through tight rolls without banding, three times. Do each rubber of the blend separately.
2. Then band both base rubbers in the formula on the slow roll of a tight cold mill. Make two 3/4 cuts from each side after 1 minute to blend the rubbers. Continue to run the banded rubber for 2 more minutes.
3. Add stearic acid, zinc oxide and Maglite D together evenly across the mill. Then add Vanax A, Methyl Ethyl Tuads, Durax and Age Rites. Make additions slowly without cutting the rubber until all the ingredients are incorporated. Then make three 3/4 cuts from each side.
4. Add half of the carbon black and half of the plasticizer evenly across the mill without cutting. When this portion of black and plasticizer is completely mixed into the rubber, open the mill to maintain a small nip. Make three 3/4 cuts from each end. Add remaining black and plasticizer evenly across the mill. When all black and plasticizer is added, make three 3/4 cuts from end to end. Cut from mill and roll the rubber.
5. Pass the rolled rubber endwise through the rolls six times.
6. Weigh and record weight of batch.
7. Sheet out and cool on bench top.

Only fresh elastomers and curatives stored less than 6 months after receipt were used.

Standard 6 X 6 X 0.080 inch test pads were cured 30 minutes at 307 deg. F. in a steam heated press, and 0.500 inch thick compression set buttons were cured 45 minutes at 307 deg. F. in an electrically heated press.

Table 3 presents data for comparison of properties of both compounds N221 and N220-1 between those mixed and cured in the laboratory and those mixed and cured in the production rubber shop. These data show that both compounds, whether mixed in the laboratory or in the production facility, meet the physical property requirements of the specified grade. However, the modulus was measured to be lower with both compounds when mixed in the shop. Compound N221 also displayed somewhat lower tensile strength in the shop mixed batch as compared with the laboratory mix.

M140 SEAL KIT:

Figure 1 shows a cut away of the M140 gun mount with the rubber seals and rings and plastic seals that make up the kit.

Elastomeric Seals:

Six single cavity steel mold was fabricated for compression molding the six seals required for the M140 gun mounts. Pertinent drawings for these seals are 8728296, 7044081, 7044083, 8448920, 8448921 and 8449265. These seal drawings are shown in Figures 2 through 7, respectively.

M140 Polytetrafluorethylene (PTFE) Back-up Rings:

The seal kit for the M140 gun mount also requires four different sizes of PTFE back-up rings (8448919, 8449266, 8448922 and 8448915) for the elastomeric seals. Figure 8 shows the role of the back-up rings (white) with the matching elastomeric seal (black). Figure 9 shows all the matching combinations; one back-up ring is used for three different seals. These pictured back-up rings are proposed replacements for the PTFE and are discussed later. The PTFE back-up rings are manufactured by machining them from PTFE tube stock, carbon filled (amorphous) 20-25 percent by weight, graphite filled (amorphous) 0-5 percent by weight. Appropriate sizes of tube stock of this PTFE material were procured and processes were developed to turn outside and inside diameter simultaneously, cut off and debur. A cutting fixture was fabricated to slit the rings, as appropriate, at a 15 degree angle scarf.

Back-up rings machined from the PTFE tube stock were measured by SMCRI-QA and were found to meet the dimensional requirements and were considered acceptable for use.

M140 Reinforced Phenolic Back-up Rings:

One cloth reinforced phenolic back-up ring (7044082) is also required for the M140 Gun Mount Kit. A blanking die was fabricated to blank out the outside and inside diameters simultaneously, and a matching die was made to separate the ring as required. The cloth reinforced phenolic sheet stock was conditioned for 24 hours at 50 ± 4 percent relative humidity at 73 ± 2 deg. F. prior to being cut. These back-up rings were found dimensionally acceptable.

Past experience has revealed that the hydroscopic nature of the cloth-filled phenolic rings presents a problem as the rings change dimensions depending on the relative humidity where these back-up rings are stored or handled during assembly. Installation of the water swollen rings becomes difficult or impossible. Therefore, nylon reinforced phenolic sheets, which are less hydroscopic, were procured for testing to ascertain the feasibility of using it as a replacement for the cloth-filled phenolic. It was intended to use the same blanking die that was previously made to cut back-up rings from the nylon filled phenolic material.

Acceptable back-up rings could not be die cut from the nylon reinforced phenolic sheet as excessing layers of nylon produced too rigid of a sheet. Edges were frayed during the blanking process, and parts meeting the dimensional requirements could not be produced.

THE FOUR TYPES OF BACK-UP RINGS FOR THE SIX
ELASTOMERIC SEALS OF THE M140 GUN MOUNT

This page intentionally left blank.

M140 Gymnastication:

The six rubber seals for the M140 Gun Mount molded from compound N220-1 were installed along with attendant commercial PTFE and cloth-filled phenolic back-up rings in an M140 Gun Mount that was exercised on a powder gymnasticator at RIA. No problems were encountered with installing the elastomeric seals in the M140 Gun Mounts. The seals were mounted in five gun mounts, and the changes in ounces were 11, 11 1/4, 11 3/4, 12 and 12 1/2. Allowable oil leakage was a maximum of 40 drops.

Gun mounts serial numbers 12307 and 12309 exceeded that limit. Disassembly and inspection of the seal systems revealed that the phenolic rings displayed excessive gaps which was attributed to the excessive leakage. The 'Weapon Firing Reports' for these gun mounts are provided in Figures 10 through 14.

Replacement of PTFE for the M140 Back-up Rings:

Current practice to fabricate the PTFE back-up rings by machining them from tube stock is not entirely satisfactory, as at times, difficulties were encountered with procurement of PTFE tube stock that could consistently meet the required physical properties, in particular the compressive strength. Furthermore, the PTFE is quite expensive, and the machining operation produces a large amount of unreclaimable scrap. The machining process is also time consuming and, therefore, costly.

Alternate materials and manufacturing techniques were studied as possible replacement of the machined PTFE. An injection moldable thermoplastic polyester material, Valox 325, was chosen as a potential replacement of the machined PTFE back-up rings. Typical physical properties of the Valox 325 material are listed in Table 4.

A contract was awarded for the fabrication of a single four cavity injection mold to produce the four different sized rings required for the kit. The four back-up rings have been molded by the contractor and are planned to be tested in conjunction with elastomeric seals in an M140 Gun Mount on the gymnasticator.

Back-up rings made by the injection molding process were not totally acceptable to drawing requirements. Surface finish did not meet the 32 RMS requirements, and concave surfaces were noted. However, polishing or other remachining of the mold could eliminate this problem. Some of the dimensions were out of tolerances. Measurement data of the plastic back-up rings is presented in Tables 5 through 8. Nonetheless, these back-up rings are satisfactory to be tested in an experimental basis in an M140 Gun Mount in a gymnasticator.

WEAPON FIRING REPORT							DATE SEPT 26. 1984	REF ID 84-32																																																																																																																																																																					
JOB ORDER NO. 12407-10000	TEST REQUEST AUTHORITY SARRI-APA LOI dated 2 Feb 78 M140A1 Recoil Mechanism					PAGE NO. 1	NO. OF PAGES 1																																																																																																																																																																						
MATERIEL TESTED: Mount, Gun: M140A1, for M60A1/A3, S/N 12307		Mfg: RIA Chrysler (X)																																																																																																																																																																											
PURPOSE OF TEST: Production Proof Acceptance																																																																																																																																																																													
Fixture and/or Materiel used in test: Powder gymnasticator, a simulation device, drawing No. 66F417. Elevation simulation equipment, drawing No. AWC 138815.																																																																																																																																																																													
AMMUNITION COMPONENTS: Case, cartridge, M18 modified, lot: mixed. Primer, percussion, M1B1A2, lot: LS-293-4. Propellant, M1, single perforated, lot: RAD 69417. Cup, closing, 75mm, RIA manufacture.																																																																																																																																																																													
TEST PROCEDURE: The mount was functioned in accordance with MIL-M-45976(WC), para 3.3.4.2. Replenisher, P/N 8689261, with MIL-H-46170 oil, used in testing the mount. Ambient temperature 56°F. Collar torque per para 3.3.2., Yes (X) No (). Replenisher oil reserve per drwg. 7389741, Yes (X) No (). Erratic operation or HOB, Yes () No (X). Case ejection, Yes (X) No ().																																																																																																																																																																													
Remarks (Continue on reverse): Special seals (Type RIA 567)

MATERIEL TESTED:

Mount, Gun: M140A1, for M60A1/A3, S/N 12309Mfg: RIA
Chrysler {X}

PURPOSE OF TEST:

Production Proof Acceptance

Fixture and or Materiel used in test:

Powder gymnasticator, a simulation device, drawing No. 66F417.
Elevation simulation equipment, drawing No. AWC 138815.

AMMUNITION COMPONENTS:

Case, cartridge, M18 modified, lot: mixed.

Primer, percussion, M1B1A2, lot: LS-393-4.Propellant, M1, single perforated, lot: RAD 69417.

Cup, closing, 75mm, RIA manufacture.

TEST PROCEDURE:

The mount was functioned in accordance with MIL-M-45976(WC), para 3.3.4.2.

Replenisher, P/N 8689261, with MIL-H-46170 oil, used in testing the mount. Ambient temperature 48.

Collar torque per para 3.3.2., Yes (X) No (). Replenisher oil reserve per drwg. 7389741, Yes (X) No (). Erratic operation or HOB, Yes () No (X). Case ejection, Yes (X) No ().

Table 4
Comparison of Valox 325 with PTFE

<u>Property</u>	<u>Valox 325*</u>	<u>Requirements for PTFE Material</u>
Tensile strength, psi	7,500	2,000 min.
Elongation %	300	**
Flexural strength	12,000	**
Compressive strength @ 10% deflection	13,000	1,700 min.
Shear strength	7,700	3,000 min.
Hardness, Shore D	68	66-70

* Typical value

** No requirement

TABLE 5
INSPECTION OF VALOX 325 BACK-UP RING 8449266

Piece I.D.	Dimension	14.376-.002 in.		.178-.004 in.		.080-.008 in.		.32 RMS		.005 in. Radius Max	
		Wall	Thickness	Height	Max	Height	Max	Max	Max	Max	Max
1	*		.169-.180			.072-.083		pass		pass	
2**	*		.160-.176			.070-.082		pass		pass	
3**	*		.160-.175			.067-.082		pass		pass	
4	*		.169-.175			.070-.082		pass		pass	
5	*		.169-.178			.069-.082		pass		pass	
6	*		.169-.178			.066-.083		pass		pass	

* Not applicable as ring was without scarf

** Reject

General notes: Excess flash on all edges.

The two parallel surfaces are visually concave.

3	*		.177-.183	.154-.171	pass
4	*		.177-.182	.152-.167	pass
5	*		.178-.183	.151-.167	pass
6	*		.178-.184	.154-.167	pass

* Not applicable as ring was without scarf.

General notes: Step on parallel surfaces. Excess flash on edges.

CONCLUSIONS:

Rubber compounds are available that meet the property requirements of material drawing 8689822 or of drawings differing only by the substitution of MIL-H-46170 hydraulic oil for MIL-H-6083.

RIA has the in-house capability to fabricate elastomeric seals, PTFE and cloth-filled phenolic back-up rings.

RECOMMENDATIONS:

Attempts should be made to formulate a single compound suitable for use in both MIL-H-6083 and MIL-H-46170.

Other materials should be sought for replacement of the cloth-filled phenolic back-up rings.

2. Seal
3. Back-up Ring
4. Injection Molding
5. Rubber

Elastomeric seals used in gun mounts have a hard to achieve combination of properties, so acceptable seals are difficult to procure and few sources are available. Therefore, two rubber formulations were developed, each for a different hydraulic oil, with the intention of providing the manufacturing data to U.S. Government activities and potential vendors.

As in-house Army fabrication capability is needed for the seal kit for the M140 gun mount, polytetrafluoroethylene (PTFE) tubes and cloth-filled phenolic sheet were procured for back-up rings in the kit. Subsequent gymnastication demonstrated Rock Island Arsenal has the capability of fabricating all the seals in the kit according to the technical data.

For improved producibility and storage and lower cost, nylon-filled phenolic and polyester thermoplastic back-up rings were fabricated to replace the phenolic and PTFE, respectively. The results to date are inconclusive.
